

. EPP Application of Car Parts

Technical molded parts made of EPP are indispensable in several industries – in car manufacturing, for example. Thanks to their outstanding energy-absorbing properties, EPP parts improve passive safety and provide better protection for vehicle occupants. Accordingly, they are used to make fenders, headrests, and other impact absorbers.

One secondary benefit is the low weight of the innovative material: EPP molded parts thus cut fuel consumption and make cars more eco-friendly. Because it can be precisely shaped, EPP also cuts a good figure elsewhere – as a sun visor, paneling, or a toolbox for precisely accommodating breakdown sets.

■ Shock Absorption Front & Rear Bumper

The front and rear bumpers are the first point of contact when a vehicle is involved in a crash. It is for this reason that car manufacturers have adopted Expanded Polypropylene (EPP) high-impact shock absorption capabilities, as the right solution to keep passengers safer.

EPP is a lightweight and durable material that is fast becoming the material of choice of automotive engineers that are in a continuous search for high performance materials that can reduce weight and CO2 emissions whilst also improving crash test results and number one keeping passengers as safe as possible.

■ EPP Car Seat with Insert Molding

EPP is widely used in seating structures to achieve significant weight reduction. Metal wires can be molded directly into an EPP part. These insert-molded components create integrated sub-assemblies that can be used as primary or secondary attachment features to the steel seat frame or for structural enhancements.

EPP Seat are designed to improve vehicle safety, strength, acoustics and comfort. EPP will make cars lighter, because it replaces heavy steel constructions in seats. It is as a replacement for the traditional metal seat structure. Total mass reduction has been as much as 1 kg with an EPP seat.
